One of our measurement tools generate an ascii output file
that looks like the following.

DEVICE LAYER SLOT DATE TIME SITE MEAS

x19y n53 B2 8/24/99 8:28:48 PM 1 0.5663

x19y n53 B2 8/24/99 8:29:20 PM 2 0.5692

x19y n53 B2 8/24/99 8:30:01 PM 3 0.5762

x19y n53 B2 8/24/99 8:32:43 PM 4 0.5666

  The data I care about for each group are in the last two
columns. I do not care about the first line. The spacing
between the columns varies.

  What is the best way to read in the lines and then store
the information from the last two columns into real arrays?

  thanks

  Peter Brooker
