Subject: call_external and f90
Posted by pei zeng on Mon, 17 Jan 2000 08:00:00 GMT

Hi:

I am using call_external to call fortran code via a C interface. I used
Makefile RSI and modified it for my application and it runs fine for f77.
Then I tried to call a f90, it works only if I don't have any I/Os. When I
do have an I/O, IDL crashs and give an error message like,
"fatal, relocation error,.....,
 symbol __f90_open not found"

the standalone version works fine.

Does anyone have an ideal how to fix it?

Thanks !
pei
