
Subject: auto updating of a nonmodal dialog widget

Hi.

I have a non modal dialog widget composed of cw_field's and a few buttons. The cw_fields are automatically filled with data from an info structure when the dialog widget is created. The idea behind the widget is to allow the user to input the desired information into the fields, hit the APPLY button and have the information in the fields sent to the appropriate info structure. Everything is working fine. However, I also have a button that allows the user to select a file to read in the same information to the same info structure. That button is also working fine. My problem is this, when the user reads in a file how do I automatically update the information in the cw_field widgets so that the user can see the data was read in correctly? Do I have to destroy the dialog widget and then create it again? Thanks.
