I am trying to overlay a map onto a dataset using mapset in combination with map_image. Mapset produces a map within the specified latitude, longitude range, and then map_image in principal is suppose to warp the data image to fit the map projection. The problem I am having is that when I call map_image it returns only an image with data. The map is absent. It is clear that the map is being produced because the map is drawn before the call to map_image. Moreover, as a test I plotted a point using plots and it plotted the point correctly given a latitude and longitude value. My question then is how do I get map_image to return the image with the map overlayed. Any help would be greatly appreciated.

Brad
