<blockquote TYPE=CITE>I am trying to create non-loopy IDL code for a project
I am working on.
<p>I have a very long list of integers ('cycle numbers') and I need some
way of

creating an array that consists of just the cycle numbers. For example
if I

had:
<p>> cycles=[2,2,2,2,2,6,6,7,7,7,9,9,9,27,27,27]
<p>then I would want a function which would do this kid of thing:
<p>> print,fn(cycles)

[2,6,7,9,27]</blockquote>
if your repeated values are adjacent, you can use

the "uniq" function.
