I got tired of this exact problem, so I took the time to write a simple windows .DLL file that has some basic file I/O routines (goodbye platform independence). Then I wrote IDL wrapper functions to delete, move, rename, and copy files and directories, as well as return file information like creation date and time, etc.

Previously, before learning how to use 'call_external', I increased the speed of multiple file operations by writing all the commands into a batch file, and then using spawn only once to execute the batch file. This saved time by only popping up one dos window.

good luck

Brad
