Hi. I am in the process of upgrading programs from Version
1, and am a bit confused by what has happened to !IGNORE.
The manual says to use /NOCLIP, but describes it as
turning on and off clipping. The reason I was using IGNORE
was because of the annoying way the vectors were altered
if points fell outside the plot axes. But, if I understand the
manual correctly, now clipping is done, which I interpret
to mean that the vectors aredrawn correctly inside the
plot axes. Is my interpretation correct? And, the NOCLIP
for the XYOUTS procedure is different from the NOCLIP
for the PLOT procedure (i.e., opposite)? Thanks for
your help!!!
