
Subject: widget to select variable

I am searching for a widget that will let you select a variable, just as `dialog_pickfile` lets you select a file. I would like to be able to select a variable from the current workspace or from a save file. Does such a beast exist? Insight has a widget which lets you import IDL variables, but I could not find the source. I have some vague ideas of how it could be done, but I'd rather avoid the pain.
