Well, in my little test program here I've got great performance with something in the middle of this range. But at the moment I can have the symbols drawn in any color I like, as long as that color is black.

I'm quite sure this is something stupid on my part, but it always seems to happen to me when I am really SUPPOSE to be doing something entirely different.

If I figure it out, I'll let you know. In the meantime, if anyone is interested in a neat, rotatable 3D scatterplot with black symbols, contact me. :-(

Cheers,

David

P.S. Did you know that the new IDL 5.3.1 update for Windows machines can improve the speed performance by up to 40%? Could be why my programs seem to be flying today. :-)
