Dear folks,

I'm a truly beginner with IDL and just encounter a problem I can't handle with the manuals I have.

I just tried to plot a map with the longitude limits 165 E - 140 W. So I used the eight element form of the LIMITS vector and put in the coordinates of my edges. What I got is a blank picture. If I use the four element vector with lonmin, lonmax parameters I ran in the problem that lonmax must be -140 and lonmin 165. A conversion to 0 - 360 degrees wasn't successful.

So have anybody a solution for the beginner?

Joerg
