Subject: What is "grid" doing?

I have some non-uniformly sampled data that I would like to re-grid, and I would like to use the "grid" function. The only problem is, I want to know what it is doing before I blindly use it. I looked in the source for the grid function, and it calls another function, this time a binary executable (called "gridder"), that does that actual regridding. Does anyone have an algorithm description for this function?

Thanks

mark
