
Subject: control precision for the axis ticks

Hi, there

We are using object graph to plot data, and some of them have values range from $1e+14$ to $1e+17$. IDL calculated the tick values and displayed them like this $1.00000000x10^{14}$ (in /LOG), which make the graph messy and ugly. Can I control the precision so it can look something like $1.00x10^{14}$?
