Hi:

I followed the discussion about object graphics and real(vector) postscript files. After I realized that object graphics can write ps vector code I'd like to renovate a widget driven tool and I'd like to have a live_tools like functionality where you click on axis, data, ... with some more options like second y axis, all the things which we have in direct graphics. Is there anything out which can provide interactive changing of axis, title, with the full set of options of PLOT, OPLOT, AXIS, ?

Thanks Theo
