Did anyone yet use pv-wave in generating rotatable 3-d molecule/cluster pictures and animations? What I have in mind would be a program as fast and easy-to-use as e.g. xmol but that allows for viewpoint selection and that makes really 3-d looking atoms.

Is it possible to make programs to this purpose which do work at acceptable animation speed but without the need to really save on disk the tormentous amount of data required for a movie of several hundreded pixel-by-pixel-calculated images?

Hints and Helps to:
