---

I have an array of 1000x1000 and I am updating someparts of it:

I would "pluckout" 20x20 for example,magnify it, change the values artound and then put it back into the array. The problem is that when I update the view with tvscl, output(40:60,60:80),40,60 for example,

it reedits a color table for thats specific square- so I have a colorful square sticking out!!!! I tried just saying tv instead of tvscl but it did not help

I certainly do not want to TVSCL, output (size of 1000!!!!) any suggestions on how to do it???? Thanks!!!

Please email the replyy to above address!

Victor
