
Subject: Setting the .pro search path for PV-WAVE

If I keep lots of .pro files in, say, the directory ~/idl,
and its subdirectories, I can cause this path to be searched
automatically when IDL finds an unknown subroutine name,
by doing something like (in unix)

```
setenv IDL_PATH +~/idl:$IDL_PATH
```

(before starting IDL).

Question: What is the equivalent command for PV-WAVE?

Thanks
