Hello,

I don't have any experience with the MacOS and IDL (but will soon.) There are features of the projects organization for Windows that I would love to be able to customize...

(1) I'd like the option of closing all of the files associated with a project when I close the project itself. Currently, when I close a project the opened procedures remain open.

(2) I'd like the option of opening some or all or none of the associated files when I open a project. Currently, when I open a project all of the associated files are opened.

Ben
