Ok, my two cents:

1) Compilation-related comments:

If you leave out an 'END' somewhere in 10000 lines of code, please don't let the compilation process scroll countless lines of compilation errors. Second, have a way to skip from error to error without searching for the little red dot. Third, try really really hard to improve the informational nature of some of those totally nondescript error descriptions.

2) Is it at all possible to simply update the color palette and see the effect w/o redrawing the image (Win95/98). I realize this might be a Win problem, but it sure would speed up an awful lot of my graphics routines if it were possible.

3) It's late - more tomorrow!

Thanks,

Bill B.
