Well, maybe I am cheating here, but as I am still considered a "young scientist", I thought I could dare ;-)

Working mostly on a Linux system and abhjorring the IDE (to me, it's just too cluttered, how can you live with three lines of 40 characters as an editor window?), I would very much like to see some more intelligence of the command line. There should be an auto-complete functionality (TAB would complete a command or give you a choice of options), and one should be able to jump back and forth with CTRL-arrow, HOME, and END, so that you don't get sore muscles when you edit commands previously entered (and you want to change the first of twenty arguments).

Just a thought (and a new thread),
Martin
