---

I will like to use a color table (e.g. 'loadct, 3') to plot some stuff in a portion of a window (e.g. lower half), and use a different one (e.g. loadct, 12) to plot something else in another part of the same window (e.g. upper half). I am using the most current version of IDL on WinNT4.

Could someone provide me some direction?

Thanks,

Mark C.
