There is a power or force in the Universe that cannot be unleashed without exiting the program. I can't explain it, but I have observed it too many times not to be a firm believer in it.

I think Pavel's original explanation is pretty close to the truth. Software that runs in heated conditions for hours at 400 Hz can get flustered. Exiting the program gives the software a chance to compose itself. It is sort of like taking the screaming baby out of the hands of a young mother for five minutes. It puts the Universe back in order and makes it possible to move forward.

An alternative technique is to have the instructor come up and look over your shoulder while you demonstrate the problem. The downfall of this technique is that it only has a 75-80% success rate.

Of course, the over-the-shoulder technique works in reverse too. Try to demo a perfectly working program to anyone higher than you on the food chain and there is at least a 75-80% chance that the program will crash in the first 30 seconds.

Cheers,

David

P.S. Let's just say life is a Mystery, and I like it that way. :-)
