Hi,

I use IDL 5.3 on a PowerBook G3. I recently got an iMac at work and copied my program over, but I'm having a hardware key problem. My PowerBook only takes serial (the HASP key I have now) and the iMac only takes USB. RSI said that they think a serial/USB adapter will work, but they don't know. Has anyone tried this? I'd like to know if it works before I go spending the \$80 for the converter. Thanks!
