Subject: widgets
Posted by Stuart Colley on Fri, 18 Aug 2000 07:00:00 GMT

I've not really used widgets before, any suggestions on how the following task might be tackled would be appreciated. What I'd like to do is display an image, stored in an array size x by y, using say tvscl, then click on part of the image with the mouse and get x, y, and the value of the array at that location.

Are there any routine(s) suited to this sort of task?
cheers,
Stu
