Subject: list widget
Posted by zeraph on Tue, 29 Aug 2000 07:00:00 GMT

Wow, you guys are getting a bit philosophical here. This is my first posting and OK you definitely have my respect, but could you possibly lower yourself to helping with questions like 'Why I don't get multiple element output from my list widget?' please?

Here is my widget_definition:
 Widget_list(tlb,sensitive=1,/multiple,ysize=26,event_pro='an ypro')

So I get my array of filenames into my list widget and then try to select four files by left click + shift left click below (or just dragging the cursor) so it highlights the desired four file names and the event.index only gives the index of the last filename.

Is there something obvious I'm doing/not doing or some secret IDL kung fu I could perform to get it to work?

Thanks very much,
Stu.
