What is "symbol clashes"? I see no symbols used at all in the example provided. I noticed nothing funny in how the provided examples work, except that the last command needs to be Oplot:

```
plot, f  
oplot, f, min=10.1, thick=2
```

Produces what's needed, a thin line overplotted with a thick one. I also fail to see the reason for "plot, f, /nodata", as the very next line replaces this first one anyway.

Cheers,
Pavel
