This is apparently an oversight in CW\_FORM code. The program CW\_FORM\_BUILD uses commas to separate fields in the descriptor elements. Thus, a statement

```
desc[2] = '0, BUTTON, B1|B2|B3, LABEL_TOP=Nonexclusive:,  
SET_VALUE=[1,1,1], COLUMN, TAG=bg1'
```

causes SET\_VALUE to be equal to string "[1" (which can not be converted to integer), and produces two unrecognized fields, "1" and "1]". So using commas to define the array of states of the buttons is not going to work. Besides that, the value does get passed to CW\_BGROUP all right. Setting SET\_VALUE to a non-zero scalar value will successfully set the first checkbox.

In order to trick the CW\_FORM, try the following:

```
desc[2] = '2, button, option1|option2|option3|option4, set_value=indgen(4)
```

and checkboxes will get set. Now, use your own creativity to come up with some meaningful expression that will define an array but will not use commas, and pass it into SET\_VALUE, to set only those buttons you want. Or, better yet, write plain and simple widget code without using CW\_FORM, which, as I'm looking at it for the second time ever, feels like an unsuccessful exercise in widget programming.

Cheers,  
Pavel.
