hello everyone,

this will probably be an easy question for all you experts out there but its got me beat -

I have been given a PV-WAVE program that simulates a certain lab experiment. The variables for this sim are defined in the source code and my mission is to add a user interface using PV-WAVE widgets that allows a user to change these variables on screen before running the simulation.

I have defined text widgets and windows and that all works fine, but i have the following problem -

there is an array, data_store, that has 10 elements (each element represents a variable) and this array is populated by a datafile (of "default" settings) when i run my program. The problem is that I want the textbox callback procedure to update the array as the values are changed by the user on screen and I cant do it...! This then needs to be linked to the simulation code but that is no problem. It is just the updating I can't do right

I tried passing values between the main procedure and the callback but i couldnt get any joy

anyone got any tips or ideas?

thanks

andy
