Subject: Base Widget PostCreation event

Hi,

I'm trying to initialise a base widgets properties after it's been
created and am unable to find an OnCreate event for the widget. The RSI
documentation gives two differing stub definitions for the
basewidget_eventcb.pro file, but seems to rely apon a PostCreation entry
in the basewidget.pro file that has been created using GUIbuilder (Which
seems to be absent on my Solaris version of IDL).

Does any one know what the callback definition should be.

Thanks

Marc
