---

An easy one for IDL gurus,

I have an IDL text object with formatting enabled, ie: yTitle =  
Obj\_New('IDLgrText', ytitle,Formatting\_Enabled=1).

I am using the !Z() embedded formatting command to specify the special symbol for (deg C) for example, and I don't know the code.

As far as know Unicode is a 16-bit superset of Ascii codes. Where can I find a list of Unicodes for Scientific symbols and especially for the degC .
