Having read the FAQ and the define_key section of the Wave manual (V 4.20):

1) Is there any way in pv-wave to increase the number of commands in
   the command history? I tried changing !edit_input to 50 in my
   startup file as suggested for IDL, but that didn't seem to work.

2) Using define_key I can succesfully map escape sequences to
   functions or other strings. I have had no luck mapping control
   characters or meta-characters (even though they both get read
   by wave into the line buffer). The documentation is a bit
   vague on whether or not I can do this, so I'm still not sure
   that I can't.

Any wizards out there who can striaghten me out?

Thanks.
