I am trying to create MPEG's using MPEG_OPEN,MPEG_PUT,MPEG_SAVE,MPEG_CLOSE suite. The problem is that the resulting mpegs are not the intended size, smaller in both x and y directions. The problem is a bit worse in the x-direction. Individual images look as if they were rebinned to the smaller size with a resulting distortion of the color table. Same images were written to gif and jpeg image files and gif movie file with no problems.

Does anyone have any suggestions?
