
Subject: idlwave xemacs: install by hand?

Hi,

I have been trying without success to get the xemacs package idlwave working (IDL works fine).

My machine is a pc with RH7 linux and cannot be connected to the network. (I have to write files to a cd from another machine and load them from that.)

How do I install it by hand? What files do I need to put where?

When I add a directory in xemacs from whence to find the binary, the package doesn't show up in the package list. I guess I must either have the wrong file, or be pointing at the wrong directory.

Thanks,
Andrew
