
Subject: IDL5.4 CALL_EXTERNAL crashes IDL under IRIX

Dear all,

We have recently upgraded from 5.3 to 5.4, using SGI IRIX 6.5. Under IDL 5.3 we have been reading GRIB data by linking to a shared library of fortran code with call_external. The same call now crashes IDL 5.4 with the message:

```
276068:/pack/idl5-5.4/idl_5.4/bin/bin.sgi/idl: rld: Fatal Error:
attempted access to unresolvable symbol in
/home/climate/idl/fk/lib/libread_grib.so: s_copy
```

I hope that somebody will be able to give a clue to what might be the problem.

Any help will be appreciated!

Greetings, Ole

The call looks like this:

```
tmp = CALL_EXTERNAL( shared_file,entry_name,filename,code,...,read_arr)
with some LONGs, strings and arrays. The large thing is
read_arr = FLTARR( 51200L*120L )
```

The fortran code is compiled with
f77 -n32 -c read_grib.f
ld -n32 -shared read_grib.o -lemon -o libread_grib.so

excerpts of the fortran:

```
SUBROUTINE read_grib(argc, argv)
  INTEGER*4 argc, argv(*)
  j= LOC(argc)

  CALL read_grib1 ( %VAL(argv(1))
```
