Martin Schultz was visiting here over the weekend, so he helped me screw my courage up to try another Linux installation on my portable computer. (And that actually went well, thank goodness.) But we decided to take advantage of a perfect Colorado day and go skiing instead of getting the IDLWAVE mode installed, so I'm doing this on my own. :-)

So what I'm thinking is, maybe JD and Carsten can have a sort of "idiot's tutorial" here. Of course, I'm not advanced enough to even get into *that* class, but I promise to save all the posts and study them diligently, and try to learn something about this thing everyone raves about. :-)

Cheers,

David

P.S. And I don't know what is going on with my computer these days. First, I can't get into the JHUAPL FTP site and then when I tried to ftp IDLWAVE 4.6 this morning, I got put into some kind of infinite loop that soaked up all my CPU cycles. Couldn't even get CTL-ALT-DELETE to do anything. In other words, this is going just about the way I expected. :-)
