
Subject: WNT environmental vars

I'm trying to get a fairly large project (~250 .pro files in several directories) working on WNT. I didn't write it want to make minimal changes for NT. The project is normally compiled and saved and has a number of batch files which do the appropriate compiles, saves, etc. These all use environmental variables in lines like:

```
.compile $IDLSRC/xxx/file.pro
```

Under Unix that works fine as long as the IDLSRC environmental variable is defined. (Works fine on VMS too using \$IDLSRC as the logical name - even with the Unix syntax.) But under WNT, IDL is looking for c:/current/dir/\$IDLSRC/xxx/file.pro (where 'c:/current/dir' is my current working directory).

Is there a way on WNT to use setenv to make this work?

Thanks,
Dave
