Okay, enough ideology for one week. Here are some brain twisters for you. See if you can decide what the output should be without running it. In each example I give the commands to paste into the command line, ending with some main-level commands to enter.

----- Example 1

```
.comp
pro test1, x, y
  help, x, y
end
```

```
a = dindgen(5)
test1, a, a
```

----- Example 2

```
.comp
function test2, x
  return, x
end
```

```
a = dindgen(5)
(test2(a))[2] = -2
print, a
```

These were a bit of a surprise for me!
Craig
