I have a 20x20 array that I would like to magnify to 200x200
It works like this- as my cursor moves around the picture, that part of the picture is magnified in real time in a second window by a facvtor of ten (20->200)
Right now I am using the REBIN routine,, and I was wondering if there is anuything FASTER than that. Is it possible to STORE THE WHOLE image magnified into the memory and just display a part of it in the window- wouldiot be faster?
If so, what is the command that SAVES the image into the memory, because
I know to retrievce, I hhave to typre: tvrd
Thanks in advance
