It says

"up runs 'previous-line'
'previous-line' is an interactive compiled Lisp function
-- loaded from "simple.elc" "

Is this how it should be ?

OK, I've found the problem. It is not related to idlwave. I'm running CDE on HP-UX and it appears that if I launch something from the desktop (like XEmacs), it does not run in my own environment. So it has no access to my environment variables. Can you believe this ? It took me quite long to find out.

Well, nevermind, sorry and thanks for trying to help.

Henk
