
Subject: IDL/Envi basic question

I am new to envi and Idl, and am having problems loading a 2 band, band sequential image into envi. I am using Envi version 3.4 which is based on IDL version 5.4. The error message I get is very cryptic for me. Here is the error message I get when trying to view the second band. The first band loads just fine.

"Envi retrieve data: Subscript range values of form low:high must be >= 0, < size with low <= high."

I am able to read this same image into other utilities, so the image seems to be OK. Any help in this matter would be greatly appreciated.

Thanks for your time.
