
Subject: axis-system variable for surface?

Hi all,

my question is a rather silly one, but I am looking and looking and looking for hours in the documentation for the system variables and can't find it:

I had to rotate a 3D-plot for more than 180 degrees and would like to know how to correct now the position of the axis, as well to change the orientation of the labels (I was just able to change the direction of the ticks by changing the sign....)

Thanks a lot for every smallest hint

Harry
