
Subject: Speaking of .wav files...

Another newbie question:

I, too, am dealing with .wav files...working with IDL to process signals in the spectral domain between FFTs and iFFTs. While I've found IDL to have extraordinary resources for visualizing and displaying data, I've not found any corresponding routines to let me render the results of my sound processing to the speakers.

Thus, is there any sort of "Play_Wav" routine? If not, has any here working with sound come up with a convenient way to get sound output from within an IDL app (other than writing a .wav file and opening a separate audio program to play it)? I'd love to include a "Play" button in my IDL user interfaces!

Thanks,
~Randy
