RDPIX I think *does* recognize the command-click. It just does not close the direct graphics window that you were clicking in. But it certainly ceases working after a command-click. If you want it to close the window, you'll have to add that to Rdpix.pro code. But if you do, it is so-o tempting to just write your own after seeing how outdated RDPIX is :-)

Cheers,
Pavel

P.S. Doesn't David sound a little worried about the reputation of his READ_PIXEL code?
