Hi, I'm using IDL 5.3 on a Mac with OS8.1. I'm trying to display a tif and interactively get the x,y of a coordinate I choose with the cursor. Ideally, I'd like my program to read my click-on x and y into variables. RDPIX doesn't recognize my cmd-click as a right mouse button so I can never get out of it. David's READ_PIXEL program doesn't display the coordinates, though it displays the image in a nice widget. Any suggestions on what I am doing wrong or other programs to do this task? Thanks!
