Hello,

here is a slight speed (and programming style) fix to the program
where_array.pro that I posted a few days ago. (thanks dave.)

replace the line that look something like the following:

```
I = AA eq BB  
la = where(i) mod Na  
lb = where(i) / na
```

with something like this:

```
I = where(AA eq BB)  
la = i mod Na  
lb = i / na
```

Kinda obvious why, but it had to be pointed out to me too. (why use two
where's if one will do.)

-stephen Strebel
(gotta love being human and being able to make pretty basic mistakes
like this)
