
Subject: Accessing an element of an array operation

Suppose I am interested in a particular element of the convolution operation.
Right now I do it as follows:

```
temp=convol(a,b)
a=temp(5)
```

.... and then I proceed to use A.

Is it possible in IDL to shorten the above by directly accessing the sixth
(in the above example) element of the convolution by doing something like:
a=convol(a,b)(5)?

(the above produces an error message)
