Hi Bernard,

I think the best way is to catch the error using a wrapper function
heres a couple of functions which I tested on Win 2000. Hope they do the
job for you.

example usage:

```
IDL> print, dir_exist("c:")
      1
IDL> print, dir_exist("f:")
      1
; eject media
IDL> print, dir_exist("f:\")
      0
IDL> safe_cd, "f:", success = success
IDL> print, success
      0
```

regards

Martin

```
;-----
-- 
; Wrapper function for CD - change directory
; Martin Downing 2000
; If it catches an error, sucess is set to 0 otherwise 1
pro safe_cd, dir, success=sucess, current = current, debug=debug

; error handling
Catch, error_status
IF Error_status NE 0 THEN BEGIN
  if keyword_set(DEBUG) then begin
    PRINT, "Directory change failed"
    PRINT, 'Error message: ', !ERROR_STATE.MSG
  endif
  success = 0
  return
ENDIF

; try to change directory
cd, dir , cur = current
; if we get this far then everything must be ok
success = 1
```

```
return
end

;-----
--  
; Test if a directory exists
function dir_exist, dir
cd, cur = cur
safe_cd, dir, success=success
if success eq 1 then cd, cur
return, success
end
```

```
;-----
```

```
--
```

```
--
```
