EMACS: CTRL+G will let you enter a line number to jump to. At least, that's my key-bindings. If you use emacs, I can let you know how to bind a key to the goto-line command.

IDL-WAVE (EMACS): CTRL+G, unless you are going to a line because of an error, in which case it is automatic.

VI: ": q <RETURN> emacs <RETURN>" is the best way to edit files in vi.

PICO: only allows line-number specification upon opening of file

% pico +nnn file_name

nano, an improved pico clone, allows jump-to, i believe.

IDLDE: CTRL+G. I've never used IDLDE, so i don't know how/if this works.

hope this helps.
