yah david,
<p>this is the microsoft service model right? software modules that fail
require system restart.
<p>sorry to be negative. your point is well taken. practically speaking
restarting the idl session sure does fix a lot of problems during development.
<p>thanks everyone for the comments,
<p>george

<p>> They recommend to always try to reproduce a problem after a complete
IDL restart.
<p>They don't just recommend it. If they are any good they
<br>require it. When I was a technical support engineer we
<br>found that 80% of the calls could be solved just by this
<br>one simple procedure.
<p>But I find I still forget to use it 75% of the time when
<br>I'm trying to figure out my own stupid mistakes. :-(
<p>Cheers,
<p>David
