---

Could someone please explain to me how is it possible to run to procedure simultaneously if they have the same parent base?

For example:

```
a=widget_base()
```

```
b=widget_base(a, event_pro='x')
```

```
c=widget_base(a,event_pro='y')
```

How can one run x and y simultaneously?

And if it's impossible, then what would you do in order to make 2 programs run simultaneously with XMANAGER, because xmanager, 'x',b and xmanager,'y',c does not work

Thanks!!!!!!!!!!!!
