I've just tried using cw_fslider for the first time. In the past I have
handled widget_slider events in their own procedure, named using
event_pro. In these procedures one of the variables in the base widget
uvalue structure is changed to the slider value.

Unfortunately the event_pro keyword is apparently not allowed in the
call to cw_fslider. Can anyone suggest the best way to handle a
cw_fslider event.

Cheers,
